- First column: comparison between logdists measured using magnitude limit of 14.0 and logdists measured using various magnitude limits.
- Second column:
    - $\Delta\text{logdist}_{14.0} = \text{logdist}^{i}_{14.0} - \text{logdist}^{0}_{14.0}$
    - $\Delta\text{logdist}_{x} = \text{logdist}^{i}_{x} - \text{logdist}^{0}_{x}$

  Where
    - $\text{logdist}^{i}_{14.0}$: logdist of galaxy i measured with magnitude limit of 14.0.
    - $\text{logdist}^{0}_{14.0}$: logdist of the fiducial galaxy measured with magnitude limit of 14.0.
    - logdist^{i}_{x}: logdist of galaxy i measured with magnitude limit of x.
    - logdist^{0}_{x}: logdist of the fiducial galaxy measured with magnitude limit of x.
- Third column: distribution of $\Delta\text{logdist}_{14.0}$ and $\Delta\text{logdist}_{x}$.
